# Chapter 1

## Preface

Automated Characterization of Health Information at Large-scale Longitudinal Evidence Systems (ACHILLES) is a profiling tool developed by the OHDSI community to provide descriptive statistics of databases standardized to the OMOP Common Data Model. These characteristics are presented graphically in the ATLAS tool. However, this solution does not allow for database comparison across the data network. The Data Network Dashboards aggregates ACHILLES results files from databases in the network and displays the descriptive statistics through graphical dashboards. This tool is helpful to gain insight in the growth of the data network and is useful for the selection of databases for specific research questions. In the software demonstration we show a first version of this tool that will be further developed in EHDEN in close collaboration with all our stakeholders, including OHDSI.

### Contributors

To develop this tool, EHDEN organized a hack-a-thon (Aveiro, December 2-3, 2019), where we defined and implemented a series of charts and dashboards containing the most relevant information about the OMOP CDM databases. The team involved in this task were composed by the following members:

- João Rafael Almeida<sup>1</sup>
- André Pedrosa<sup>1</sup>
- Peter R. Rijnbeek<sup>2</sup>
- Marcel de Wilde<sup>2</sup>
- Michel Van Speybroeck<sup>3</sup>
- Maxim Moinat<sup>4</sup>
- Pedro Freire<sup>1</sup>
- Alina Trifan<sup>1</sup>
- Sérgio Matos<sup>1</sup>
- José Luís Oliveira<sup>1</sup>

- 1 - Institute of Electronics and Informatics Engineering of Aveiro, Department of Electronics and Telecommunication, University of Aveiro, Aveiro, Portugal
- 2 - Erasmus MC, Rotterdam, Netherlands
- 3 - Janssen Pharmaceutica NV, Beerse, Belgium
- 4 - The Hyve, Utrecht, Netherlands

## Considerations

This manual was written to be a guide for a clean installation of this system with all the dashboards that we defined during the project. The first chapter describes the goal of the system and the second how to install the system. The remaining chapters are dedicated to the dashboards, in which chapters describes one dashboard and all its charts. To simplify the representation of the dashboard's layout, we used similar schemas as it is presented in Figure 1.1. The white box is the dashboard and the inside boxes are charts. The colour changes in relation to the type of chart.

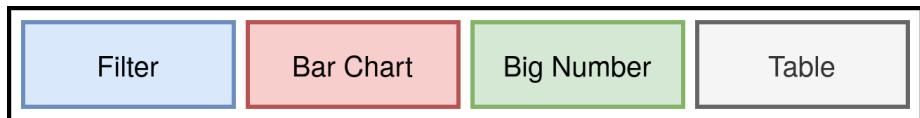

Figure 1.1: Example of a dashboards tool presenting the databases available in the network (simulated data)

## License

The system is open-source and this manual was written in RMarkdown using the bookdown package.

## Acknowledges

This work has been conducted in the context of EHDEN, a project that receives funding from the European Union's Horizon 2020 and EFPIA through IMI2 Joint Undertaking initiative, under grant agreement No 806968.

# Chapter 2

## Introduction

The OHDSI research network has been growing steadily which results in an increasing number of healthcare databases standardized to the OMOP CDM format. The OHDSI community created the ACHILLES tool (Automated Characterization of Health Information at Large-scale Longitudinal Exploration System) to characterize those databases. The results are available to the data custodian in their local ATLAS tool and helps them to gain insights in their data and helps in assessing the feasibility of a particular research questions.

ACHILLES was designed to extract the metadata from a single database, which by itself does not allow the comparison with the remaining databases in the network. However, we believe there is even more value in sharing this information with others to enable network research in a Data Network Dashboard.

### Data Network Dashboard

The European Health Data and Evidence Network (EHDEN) project therefore designed a Data Network Dashboard tool, a web application to aggregate information from distributed OMOP CDM databases. It uses the ACHILLES results files to construct graphical dashboards and enables database comparison (Figure 2.1). The tool is built on Apache Superset, which is an open-source enterprise-ready business intelligence web application that can provide powerful and fully customizable graphical representations of data. Achilles results can be uploaded through the EHDEN Database Catalogue using the dashboards plugin but can also be directly uploaded in the tool. Figure 1. Example of a dashboards tool presenting age and gender distributions (simulated data).

In this tools, we defined and implemented a series of charts and dashboards containing the most relevant information about the databases, such as:

- **General:** dashboards that shows the databases types per country, the distribution of data source types, the growth of the Network including

Figure 2.1: Example of a dashboards tool presenting the databases available in the network (simulated data)

the number of database and the number of patients in the databases over time;

- **Person:** representing the number of patients per country, age distribution at first observation, year of birth distribution and normalized gender distribution;
- **Population characteristics:** dashboard with the cumulative patient time, persons with continuous observation per month, and the start and end dates of those periods;
- **Visit:** chart to compare the number and type of visit occurrence records;
- **Death:** information about the number of death records by month, and the patient age at time of death;
- **Concepts:** bubble chart which shows the number of patients and records per concept over the databases;
- **Data domains:** heat map visualization of the major data domains in each database.

# Chapter 3

## Installation

Currently, we use docker to deploy our environment

### First Steps

1. Clone the repository with the command `git clone --recurse-submodules https://github.com/EHDEN/NetworkDashboards`. If you already cloned the repository without the `--recurse-submodules` option, run `git submodule update --init` to fetch the superset submodule.
2. Create a `.env` file on the `docker` directory, using `.env-example` as a reference, setting all necessary environment variables (`SUPERSET\_MAPBOX\_API\_KEY` and `DASHBOARD\_VIEWER\_SECRET\_KEY`).

### Dashboard Viewer setup

1. If you wish to expose the dashboard viewer app through a specific domain(s) you must add it/them to the `ALLOWED_HOSTS` list on file `dashboard_viewer/dashboard_viewer/settings.py` and remove the `'*'` entry.
2. Build containers' images: `docker-compose build`. This might take several minutes.
3. Set up the database and create an admin account for the dashboard viewer app: `docker-compose run --rm dashboard ./docker-init.sh`.

### Insert Concepts

The concepts table is not in the repository due to its dimension, therefore we use directly the Postgres console to insert this table in the installation.

1. Get your concept csv file from Athena

2. Copy the file into postgres container

```
docker cp concept.csv dashboard_viewer_postgres_1:/tmp/
```

3. Enter in the postgres container:

```
docker exec -it dashboard_viewer_postgres_1 bash
```

4. Enter in the `achilles` database (value of the variable `POSTGRES_ACHILLES_DB` on the `.env` file) with the `root` user (value of the variable `POSTGRES_ROOT_USER` on the `.env` file):

```
psql achilles root
```

5. Create the `concept` table

```
CREATE TABLE concept (
    concept_id      INTEGER      NOT NULL,
    concept_name    VARCHAR(255) NOT NULL,
    domain_id       VARCHAR(20)   NOT NULL,
    vocabulary_id   VARCHAR(20)   NOT NULL,
    concept_class_id VARCHAR(20)  NOT NULL,
    standard_concept VARCHAR(1)   NULL,
    concept_code    VARCHAR(50)   NOT NULL,
    valid_start_date DATE        NOT NULL,
    valid_end_date  DATE        NOT NULL,
    invalid_reason  VARCHAR(1)   NULL
);
```

6. Copy the CSV file content to the table (this could take a while)

To get both ' (single quotes) and " (double quotes) on the `concept_name` column we use a workaround by setting the quote character to one that should never be in the text. Here we used \b (backslash).

```
COPY public.concept FROM '/tmp/concept.csv' WITH CSV HEADER
  DELIMITER E'\t' QUOTE E'\b';
```

7. Create index in table (this could take a while):

```
CREATE INDEX concept_concept_id_index ON concept (concept_id);
CREATE INDEX concept_concept_name_index ON concept (concept_name);
```

8. Set the owner of the `concept` table to the `achilles` user (value of the variable `POSTGRES_ACHILLES_USER` on the `.env` file):

```
ALTER TABLE concept OWNER TO achiller
```

9. Bring up the containers: `docker-compose up -d`.

10. Run the command `docker-compose run --rm dashboard python manage.py generate_materialized_views` to create the materialized

views on Postgres.

## Superset setup

1. Make sure that the container `superset-init` has finished before continuing. It is creating the necessary tables on the database and creating permissions and roles.
2. Execute the script `./superset/one_time_run_scripts/superset-init.sh`. This will create an admin account and associate the `achilles` database to Superset. **Attention:** You must be in the docker directory to execute this script.
3. We have already built some dashboards so if you want to import them run the script `./superset/one_time_run_scripts/load_dashboards.sh`. **Attention:** You must be in the docker directory to execute this script.
4. If you used the default ports:
  - Go to `http://localhost` to access the dashboard viewer app.
  - Go to `http://localhost:8088` to access superset.
5. On release 0.37 of Superset, there is a bug related to the public role and because of that, we had to set `PUBLIC_ROLE_LIKE_GAMMA = True` on Superset settings. This leads the public role with permissions that he shouldn't have. To solve this, so any anonymous user can view dashboards, you should remove all its permissions and then add the following:
  - can explore JSON on Superset
  - can dashboard on Superset
  - all datasource access on all\_datasource\_access
  - can csrf token on Superset
  - can list on CssTemplateAsyncModelView

## Dummy data

On a fresh installation, there are no `achilles_results` data so Superset's dashboards will display "No results". On the root of this repository, you can find the `demo` directory where we have an ACHILLES results file with synthetic data that you can upload to a data source on the uploader app of the dashboard viewer (`localhost/uploader`). If you wish to compare multiple data sources, on the `demo` directory there is also a python script that allows you to generate new ACHILLES results files, where it generates random count values based on the ranges of values for each set of `analysis_id` and strata present on a base ACHILLES results file. So, from the one ACHILLES results file we provided, you can have multiple data sources with different data.

# Chapter 4

## Processes

### Data Sources

#### **Target:** platform user

Before uploading any data to this platform, a data source owner has to create a data source instance to then associate the upload data with.

The creation of data source is done through the `[BASE_URL]/uploader/` URL, where 7 fields are expected:

1. name: an extensive name
2. acronym: a short name
3. country: where is the data source localized
4. link (Optional): web page of the data source
5. database type: type of OMOP database
6. coordinates: a more accurate representation of the data source's localization
7. hash (Optional): the internal unique identifier of a data source

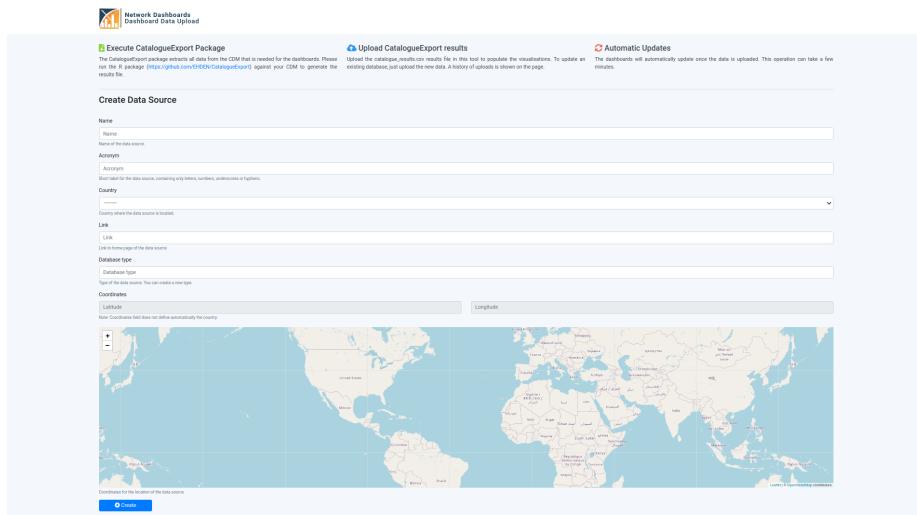

If you access `[BASE_URL]/uploader/` the 7th field (hash) is set automatically for something random, however, if you want to set it use the `[BASE_URL]/uploader/[HASH]/` URL.

To avoid duplication on the database type field, this field is transformed (use title case and trimmed) and then is checked there is already a record (Database Type) with the same value.

There are several ways to create a data source:

1. Create through a web form

By accessing the `[BASE_URL]/uploader/` URL, you will get a form where you can fill the fields, where the country field is a dropdown and the coordinates field is set through a map widget.

2. Automatically create when performing a GET to the [BASE\_URL]/uploader/ URL

If the Network Dashboards platform is being used as a third-party application and the main application has all the data for the required fields, the data source can be automatically created and the user is redirected directly to the upload files page.

To perform this, each field should be provided as a URL parameter when accessing the [BASE\_URL]/uploader/ URL. If all required fields are provided and are valid the data source is created and the user is redirected to the upload files page. If a required field is missing or is not valid the webform is presented to the user so it can manually fill those fields.

3. Automatically create by performing a POST to the [BASE\_URL]/uploader/ URL

Since the creation URL does not have csrf cookie protection, you can perform a POST request as you were submitting a form.

**Notes For the automatic options:** -. Since the coordinates field is composed of two fields (latitude, longitude), it should be submitted as `coordinates_0=[latitude]` and `coordinates_1=[longitude]` -. The country field should match one of the available on the dropdown of the webform.

## Catalogue Results Files

### Target: platform user

Once a data source is created you can access its upload page by accessing the [BASE\_URL]/uploader/[HASH]/. If no data source has the provided hash you

will be redirected back to the data source creation form.

On the upload page you can:

1. Go to the edit page of your data source
2. Upload a catalogue results file
3. Check the upload history

A catalogue results file is a CSV file, the result obtained after running the EHDEN/CatalogueExport R package on an OMOP database. It is a variant of the OHDSI/Achilles where it only extracts a subset of analyses of the ACHILLES' original set.

The upload form expects a CSV file with the following columns:

Name	Type	Required/Non-Nullable/Non-Empty
analysis_id	int	Yes
stratum_1	string	No
stratum_2	string	No
stratum_3	string	No
stratum_4	string	No
stratum_5	string	No
count_value	int	Yes
min_value	double	No
max_value	double	No
avg_value	double	No
stdev_value	double	No
median_value	double	No
p10_value	double	No
p25_value	double	No
p75_value	double	No
p90_value	double	No

The uploaded file must:

- either contain the first 7 columns OR all 16 columns
- contain the columns in the same order as presented in the table above

While parsing the uploaded file, some data is extracted to then present on the Upload history and to update data source information. This data is extracted from the record with analysis id 0, **which is required to be present on the file**, and 5000, which is optional. Next is presented the data extracted and their description:

- R Package Version: the version of CatalogueExport R package used
- Generation Date: date at which the CatalogueExport was executed on the OMOP database

- Source Release Date: date at which the OMOP database was released
- CDM Release Date: date at which the used CDM version was released
- CDM Version: version of the CDM used
- Vocabulary Version: version of the vocabulary used

The next table is presented where the previous data is stored on the rows with analysis id 0 and 5000:

Analysis Id	Stratum 1	Stratum 2	Stratum 3	Stratum 4	Stratum 5
0		R Package Version	Generation Date		
5000		Source Release Date	CDM Release Date	CDM Version	Vocabulary Ver

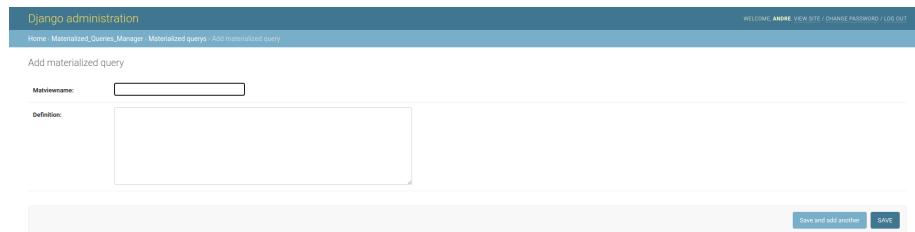

## Materialized Views

**Target: admin user**

For each chart, Superset has an underlying SQL query which in our case is run every time a chart is rendered. If one of these queries takes too long to execute the charts will also take too long until they are rendered and eventually users might get timeout messages given a bad user experience.

To avoid this problem, instead of executing the raw SQL query we create a postgres materialized view of the query, which is then used to feed the data to the chart. So only a simple `SELECT x FROM x` query is executed when a chart is rendered.

So whenever I create a chart I have to access the Postgres console? No, we created an unmanaged Materialized Queries model that maps to the materialized views on Postgres. With it you can create new materialized views through the Django admin app, by accessing the `[BASE_URL]/admin/` URL.

You have to provide the materialized view name and its query, which will then be used to execute the query `CREATE MATERIALIZED VIEW [name] AS [query]`, which will be executed on a background task so the browser doesn't hang and times out, in case of complicated queries. Taking this into account, the record associated will not appear on the Django admin app until the `CREATE MATERIALIZED VIEW` query finishes.

To give feedback on the background task we use celery/django-celery-results, so you can check the status of a task on the Task Results model of the Celery Results app

The screenshot shows the Django administration interface. The top navigation bar is dark blue with the text "Django administration". Below it, a light blue header bar says "Site administration". The main content area has several sections:

- AUTHENTICATION AND AUTHORIZATION**: Contains links for "Groups" and "Users", each with "Add" and "Change" buttons.
- CELERY RESULTS**: Contains a link for "Task results", which is highlighted with a red box. It also has "Add" and "Change" buttons.
- CONSTANCE**: Contains a link for "Config", with a "Change" button.
- MATERIALIZED\_QUERIES\_MANAGER**: Contains a link for "Materialized queries", with "Add" and "Change" buttons.
- TABSMANAGER**: Contains links for "Tab groups" and "Tabs", each with "Add" and "Change" buttons.
- UPLOADER**: Contains links for "Countries", "Data sources", "Database types", and "Upload histories", each with "Add" and "Change" buttons.

After the creation of a Materialized Query, there will be a message telling the id of the task which is executing the CREATE MATERIALIZED VIEW query. You can then check for the record associated with the task, click on the id to get more details. If something went wrong check the error message either on Result Data or Traceback fields under the Result section

The screenshot shows a task result page with the following details:

- Result:** "Materialized view test2 successfully created".
- Created DateTime:** Feb. 19, 2021, 8:45 p.m. (Eastern time when the task result was created in UTC).
- Completed DateTime:** Feb. 19, 2021, 8:45 p.m. (Same as created date, indicating task completed in UTC).
- Traceback:** None.
- Task Meta Information:** (Follow) [JSON] (CSV) (Raw) (Copy) (Delete)

At the bottom right, there are buttons: "Save and add another", "Save and continue editing", and a large blue "SAVE" button.

After all this, the final step is to add the materialized view as a Dataset. Login into Superset, then go to Data -> Datasets and create a new one. Select the **Achilles** database, the **public** schema, then the created materialized view and click “ADD”. After this, the materialized view can be used as a data source for a new chart.

## Tabs View [Deprecated]

**Target:** admin user

# Chapter 5

## Dashboards

### 5.1 General

#### CSS

To hide the dashboard header insert the following css code to the `CSS` field on the edit page:

```
.dashboard > div:not(.dashboard-content) { /* dashboard header */
  display: none;
}
```

With this every time you want to edit the dashboard layout you have to either comment the CSS inserted or remove it so the “Edit Dashboard” button can show again.

#### Database Type and Country Filter

These filters were designed to be used in the dashboard aiming the filtering of the data based on the field “database\_type” and “country” from the table “data\_source”.

**For the filters to work the name of the fields to filter should match in all tables used on the charts of this dashboard.**

#### SQL query

```
SELECT source.name,
       country.country,
       source.database_type,
       source.acronym
```

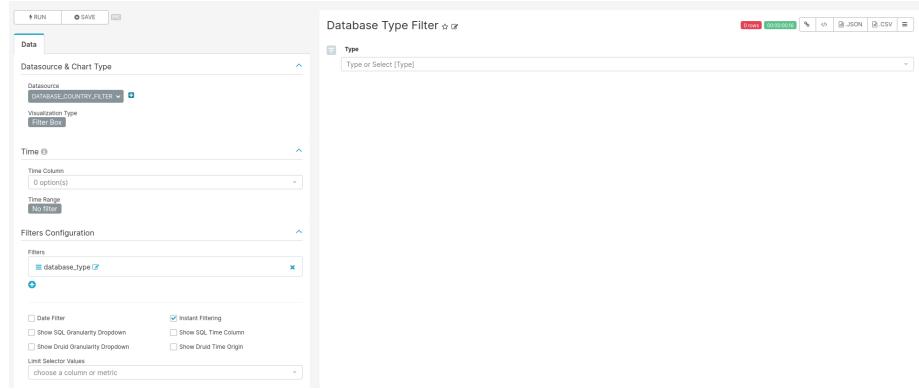

Figure 5.1: Settings for creating filters charts

```
FROM public.data_source AS source
INNER JOIN public.country AS country ON source.country_id=country.id

- \* Columns: name, source\_release\_date, cdm\_release\_date, cdm\_version, vocabulary\_version

## 5.2 Person

### Label Colors

In order to obtain the colors blue and rose in the chart representing the gender distribution, add the following JSON entry to the JSON object of the **JSON Metadata** field on the edit dashboard page:

```
"label_colors": {
    "Male": "#3366FF",
    "Female": "#FF3399"
}
```

### CSS

To hide the dashboard header insert the following css code to the **CSS** field on the edit page:

```
.dashboard > div:not(.dashboard-content) { /* dashboard header */
    display: none;
}
```

With this every time you want to edit the dashboard layout you have to either comment the CSS inserted or remove it so the “Edit Dashboard” button can show again.

### Data Source Filter

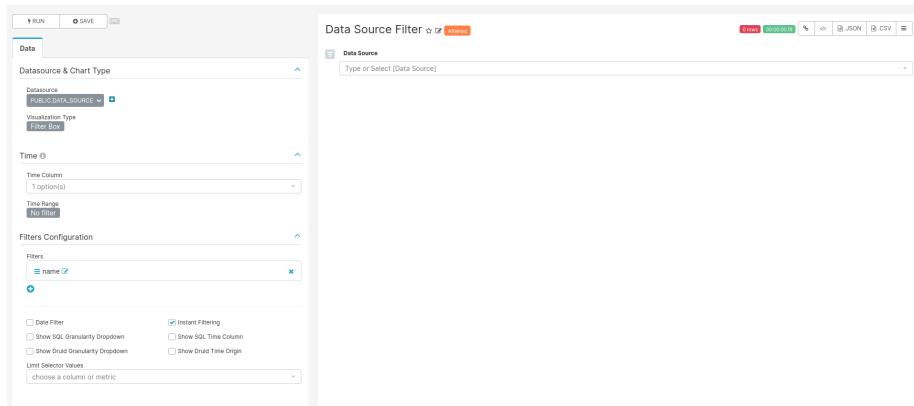

Figure 5.8: Settings for creating the Data Source filter chart

For the filter to work the name of the fields to filter should match in all tables used on the charts of this dashboard.

### SQL query

No SQL query, use the sql table `data_source` of the `achilles` database.

### Chart settings

- Data Tab
  - Datasource & Chart Type
    - \* Visualization Type: Filter Box

## 5.3 Observation Period

### CSS

To hide the dashboard header insert the following css code to the CSS field on the edit page:

```
.dashboard > div:not(.dashboard-content) { /* dashboard header */
  display: none;
}
```

With this every time you want to edit the dashboard layout you have to either comment the CSS inserted or remove it so the “Edit Dashboard” button can show again.

### Data Source Filter

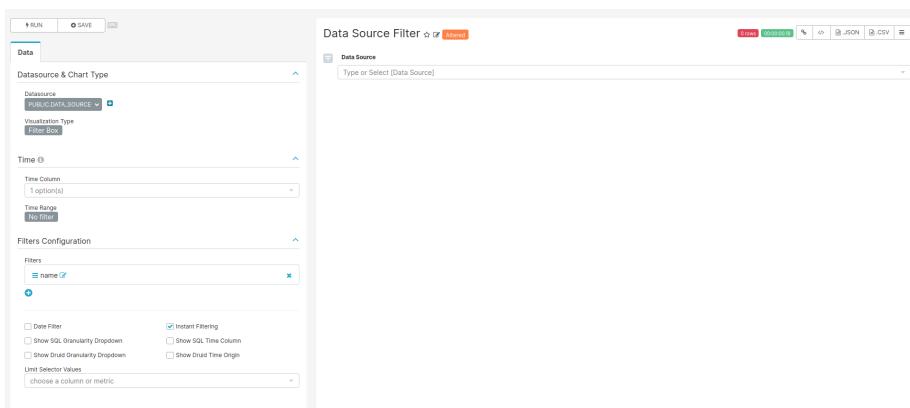

Figure 5.13: Settings for creating the Data Source filter chart

For the filter to work the name of the fields to filter should match in all tables used on the charts of this dashboard.

### SQL query

No SQL query, use the sql table `data_source` of the `achilles` database.

## 5.9 Per Database

### Label Colors

In order to obtain the colors blue and rose in the chart representing the gender distribution, add the following JSON entry to the JSON object of the **JSON Metadata** field on the edit dashboard page:

```
"label_colors": {
    "Male": "#3366FF",
    "Female": "#FF3399"
}
```

### CSS

To hide the dashboard header insert the following css code to the **CSS** field on the edit page:

```
.dashboard > div:not(.dashboard-content) { /* dashboard header */
  display: none;
}
```

With this every time you want to edit the dashboard layout you have to either comment the CSS inserted or remove it so the “Edit Dashboard” button can show again.

### Data Source Filter

**For the filter to work the name of the fields to filter should match in all tables used on the charts of this dashboard.**

### SQL query

No SQL query, use the sql table **data\_source** of the **achilles** database.

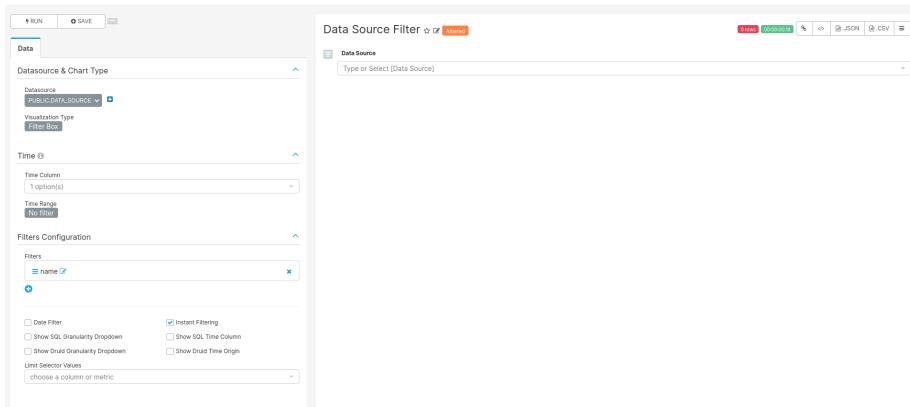

Figure 5.30: Settings for creating the Data Source filter chart

### Chart settings

#### **Age at first observation - Table**

Same chart as the one used on the Person dashboard.

#### **Age at first observation - Bars**

Same chart as the one used on the Person dashboard.

#### **Year of Birth**

Same chart as the one used on the Person dashboard.

#### **Data Domains Tab**

##### **Average Number of Records per Person**

Same chart as the one used on the Data Domains dashboard.

##### **Total Number of Records**

```
SELECT
  data_source.name,
```

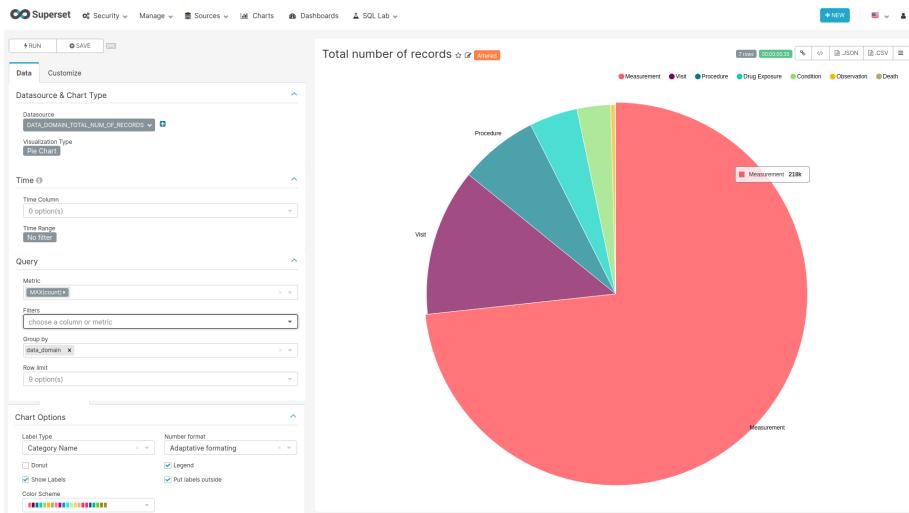

Figure 5.34: Settings for creating the Total Number of Records chart

```

data_source.acronym,
CASE
    WHEN analysis_id = 201 THEN 'Visit'
    WHEN analysis_id = 401 THEN 'Condition'
    WHEN analysis_id = 501 THEN 'Death'
    WHEN analysis_id = 601 THEN 'Procedure'
    WHEN analysis_id = 701 THEN 'Drug Exposure'
    WHEN analysis_id = 801 THEN 'Observation'
    WHEN analysis_id = 1801 THEN 'Measurement'
    WHEN analysis_id = 2101 THEN 'Device'
    WHEN analysis_id = 2201 THEN 'Note'
END AS Data_Domain,
SUM(count_value) AS "count"

## Data Provenance Tab

Same six charts used on the Provenance dashboard.

## Observation Period Tab

### Number of Patients in Observation Period

Same chart used on the Observation Period dashboard.

### Cumulative Observation Period

The cumulative observation time plot shows the percentage of patients that have more than X days of observation time.

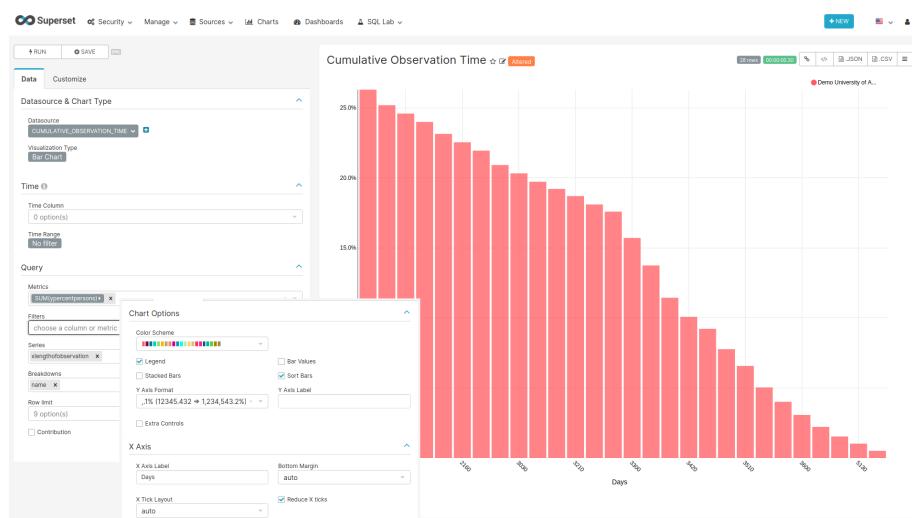

Figure 5.35: Settings for creating the Total Number of Records chart

```
SELECT
    name,
    acronym,
    xLengthOfObservation,
    round(cumulative_sum / total, 5) as yPercentPersons
```

```

## Concept Browser Tab

### Concept Browser Table

Same chart used on the Concept Browser dashboard.

## Meta Data Tab

### Meta Data Table

Same chart used on the General dashboard.

## 5.10 Database Level Dashboard

This dashboard is an exact copy of the Per Database dashboard but several legends and fields displayed on the original are hidden either through CSS or by changing some chart settings. On the following sections we will only present the things to change on the original charts.

### Label Colors

In order to obtain the colors blue and rose in the chart representing the gender distribution, add the following JSON entry to the JSON object of the **JSON Metadata** field on the edit dashboard page:

```
"label_colors": {
  "Male": "#3366FF",
  "Female": "#FF3399"
}
```

### CSS

To hide the dashboard header insert the following css code to the **CSS** field on the edit page:

```

/* hides the filter badges on right side of charts */
.dashboard-filter-indicators-container {
    display: none;
}

/* hides the acronym filter */
.grid-content > .dragdroppable.dragdroppable-row > .with-popover-menu {
    display: none;
}

/*
WARNING panel 1 id hardcoded
Hides the X Axis Label of the heatmap on the Data Domains tab
*/
#TABS-nLIU6H5mcT-pane-1 g.x.axis > g.tick text {
    display: none;
}

/*
WARNING panel 2 id hardcoded
Hides the X Axis Labels of the bar charts on the Data Provenance tab
*/
#TABS-nLIU6H5mcT-pane-2 g.nv-x.nv-axis.nvd3-svg > g.nvd3.nv-wrap.nv-axis > g > g.tick.zero > text {
    display: none;
}

```

With this every time you want to edit the dashboard layout you have to either comment the CSS inserted or remove it so the “Edit Dashboard” button can show again.

## Data Source Filter - hidden

For the filter to work the name of the fields to filter should match in all tables used on the charts of this dashboard.

### SQL query

No SQL query, use the sql table `data_source` of the `achilles` database.

### Chart settings

- Data Tab
  - Datasource & Chart Type
    - \* Visualization Type: Filter Box
  - Time
    - \* Time range: No filter
  - Filters Configuration
